Proposed Information for Management
Group A: William Camacho, Cindy Chen, Max Yan, Franklin Dong

      The primary method for maintaining the database will be through interactions with our website, which will be connected to our database. On the website, there will be two log-in buttons: one for employees and the other for customers, which includes both guests and hosts. Each will lead the user to a different page depending on their credentials. Any person wishing to make a reservation must first log in or register for an account.

      Employees, when logged in, will have a more sophisticated view that allows them to input information about multiple guests, hosts, or reservations, and to retrieve data about a customer, event, or a reservation. Customers, on the other hand, will only be able to make a reservation and view their own reservation information. When a customer makes a reservation, the information they input gets directly transcribed into the database, in addition to any information employees may enter.

      Additionally, employees can also view the layout of all rooms and the catalog of all events. These two buttons on the employee home page will take them to the corresponding pages. For the layout of all rooms, the landing page will show a graphical representation of them, showing a room and its two neighboring rooms. Users will then have the option to click on one of the rooms represented graphically to be taken to that room's specific page, or they can search for a specific room and be directed to that room's page. For the all-events catalog, the landing page will display a list of all scheduled events, including their hosts, billed party, and other relevant details.

      Additionally, there is an option on the employee login page to view all transactions. This button directs the employee to the transaction page, where each item specifies the guest, charge amount, and other relevant details.
